

# LectureAssist: An Agentic, Multimodal AI Assistant for Lecture-Grounded Study Material

Iftikhar Ahmed · Salman Shafi · Jarinah Tasnim  
Supervisor: Dr. Adnan Areefen

## Problem

- Lecture knowledge is locked in **video, speech and board writing**.
- Generic quiz tools produce **ungrounded, off-topic** questions.
- Fixed difficulty ignores **each student's weak topics**.

**Goal.** Grounded, validated, adaptive study material — fully local, **zero API cost**, on one free Colab T4.

## Evaluation Setup

- Source.** OpenStax *Calculus Vol. 1*, Limits chapter ( $\approx 112k$  characters), also given to the judge as ground truth.
- Scale.**  $n=200$  MCQ per pipeline — easy 68, medium 66, hard 66.
- Fairness.** Identical sliding window for both pipelines, so any difference reflects **prompting strategy alone**.
- Models.** Generator **gemma3:4b**, judge **gemma3:12b**, both local.

## The System in Use

Figure 1. Upload page. Drag-and-drop for video or documents; the four counters fill in from the run once processing completes.

Figure 2. Quiz Engine. Four question types, generation modes, and a timer; the agent workspace streams the pipeline live during generation.

## System Architecture

All agents run gemma3-4b served locally by Ollama; the independent judge is gemma3-12b. The Controller assigns each slot exactly one cognitive track, so the spread is enforced rather than requested.

Figure 3. Multimodal extraction feeds a grounded knowledge base; the orchestrator coordinates the specialist agents that produce every study artifact. Independent agents run concurrently and any agent crash is isolated.

## Agentic Quiz Generation

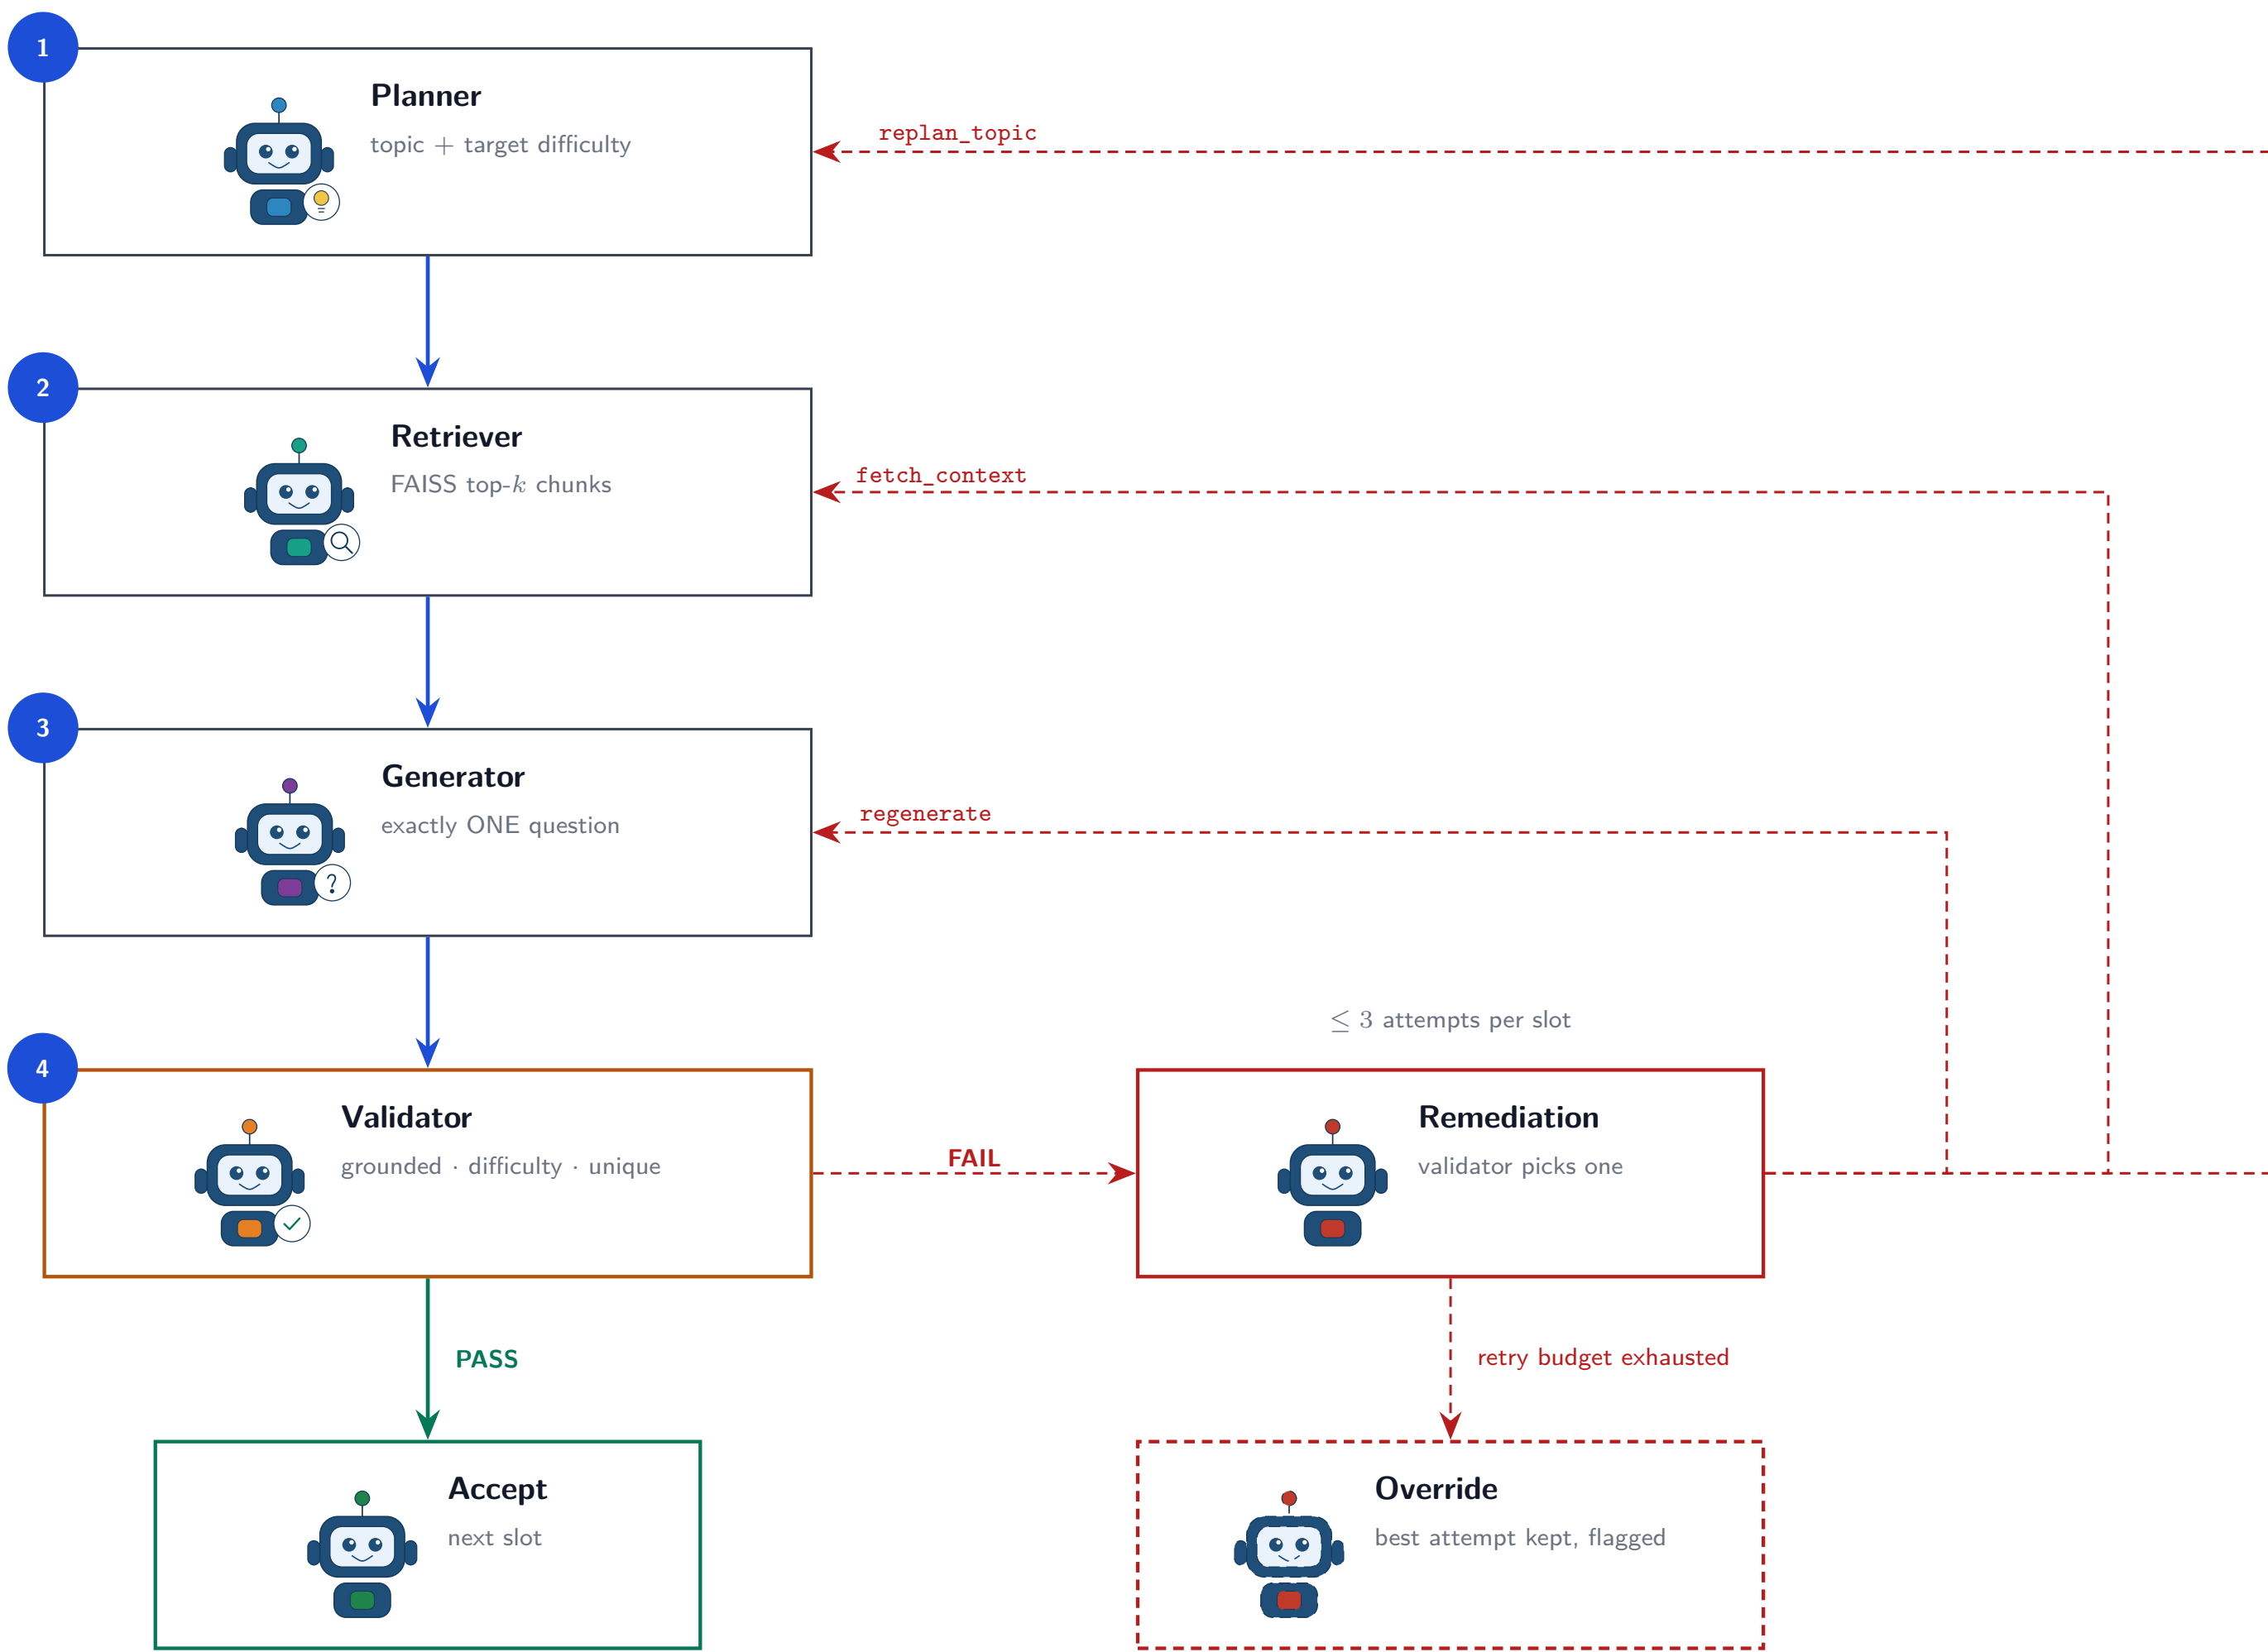

Figure 4. One question per slot; each must pass validation before the next begins. An exhausted retry budget flags an override, never a pass.

## Results

| Metric                        | Agen. | Non-ag. |
|-------------------------------|-------|---------|
| <i>Judged 1–5 (saturated)</i> |       |         |
| Overall                       | 4.86  | 4.93    |
| Correctness                   | 4.98  | 5.00    |
| Clarity                       | 4.92  | 4.97    |
| Difficulty                    | 4.36  | 4.39    |
| <i>Automated 0–1</i>          |       |         |
| Duplicate ↓                   | 0.385 | 0.280   |
| Grounding                     | 0.557 | 0.624   |
| Eff. accept                   | 0.612 | 0.720   |
| Answer match                  | 0.940 | 0.970   |
| Similarity ↓                  | 0.932 | 0.894   |
| Accept rate                   | 0.995 | 1.000   |
| Verified                      | 0.995 | 0.995   |

| Diff.  | Pipe.   | Dup.↓ | Grnd. | Eff.  | Match |
|--------|---------|-------|-------|-------|-------|
| Easy   | Agen.   | 0.353 | 0.562 | 0.647 | 0.971 |
|        | Non-ag. | 0.324 | 0.642 | 0.676 | 0.971 |
| Medium | Agen.   | 0.379 | 0.595 | 0.612 | 0.879 |
|        | Non-ag. | 0.227 | 0.614 | 0.773 | 0.955 |
| Hard   | Agen.   | 0.288 | 0.513 | 0.712 | 0.970 |
|        | Non-ag. | 0.182 | 0.616 | 0.818 | 0.985 |

The pattern holds at every difficulty: the baseline leads on duplicate rate, grounding and effective acceptance in all three bands.

$n=200$  per pipeline. Green marks the better value; ↓ marks rows where lower is better. Per-difficulty  $n=68/66/66$ .

Figure 5. The three metrics that discriminate. Lower is better for duplicate rate, so the baseline leads on all three.

## Conclusion

A fully local, \$0-API multimodal pipeline that turns a lecture into grounded, validated study material. The judged dimensions **saturate** (4.36–5.00), so only the automated metrics discriminate — and on those the agentic loop does **not** beat single-pass prompting. The engineering contribution stands; the scientific claim is **not established**, and we report it that way.

Figure 6. Duplicate rate by difficulty — the agentic loop duplicates more in every band.
